

The role of mother and father attachment in children's socioemotional adjustment: A Bayesian model comparison approach

Claudio Zandonella Callegher, Tatiana Marci & Gianmanrco Altoè Department of Developmental and Social Psychology, University of Padua

The Present Study

Theoretical background:

- Attachment relationships play a key role in children's socioemotional adjustment (Cassidy & Shaver, 2016)
- Both mother and father attachment are considered important. However, research to date has largely focused on mother-child attachment.

Objectives:

- Evaluate the contribution of mother and father attachment to children's socioemotional-adjustment in middle childhood.
- Simultaneously compare different theoretical prespectives within a Bayesian model comparison approach.

Method

Participants: 166 children (54% girls) were recruited from Italian primary schools (45% 3^{rd} grade, 55% 4^{th} grade).

Instruments:

- Security Scale (SS; Kerns et al., 2001); Self-report measuring attachment towards mother and father separately.
- Strengths & Difficulties Questionnaire (SDQ; Goodman, 2001); School teachers evaluated children's internalizing and externalizing problems.
- Family Affluence Scale (FAS; Boyce, et al., 2006); Self-report for measuring socioeconomic status.

Results

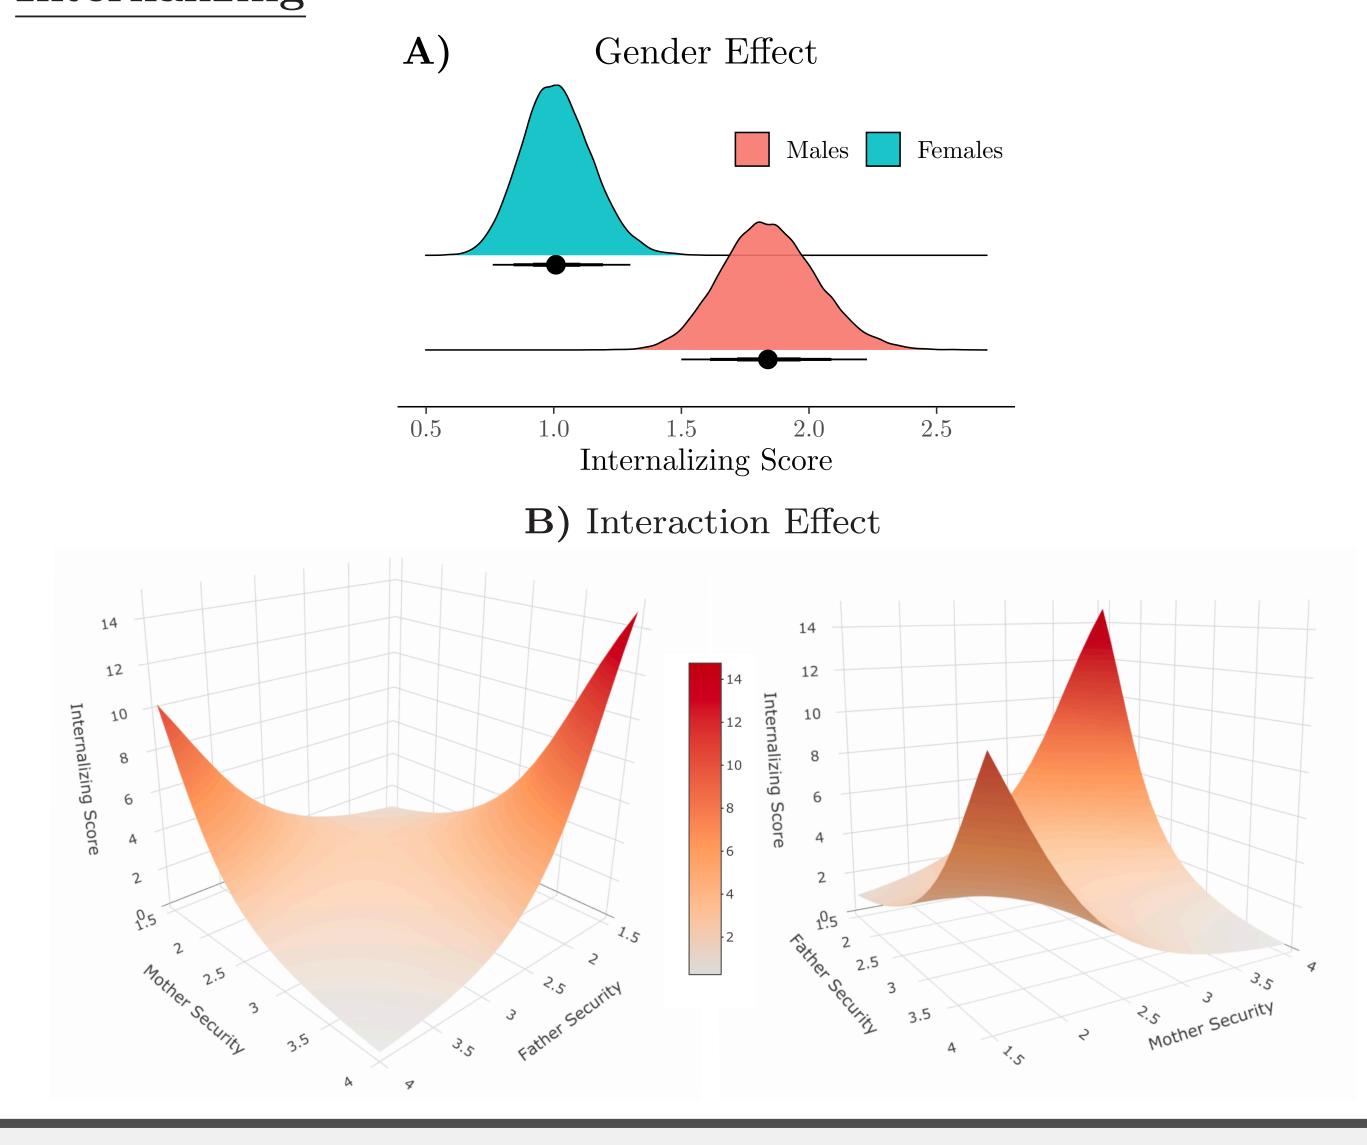

• Model comparison

Weights for internalizing and externalizing problems

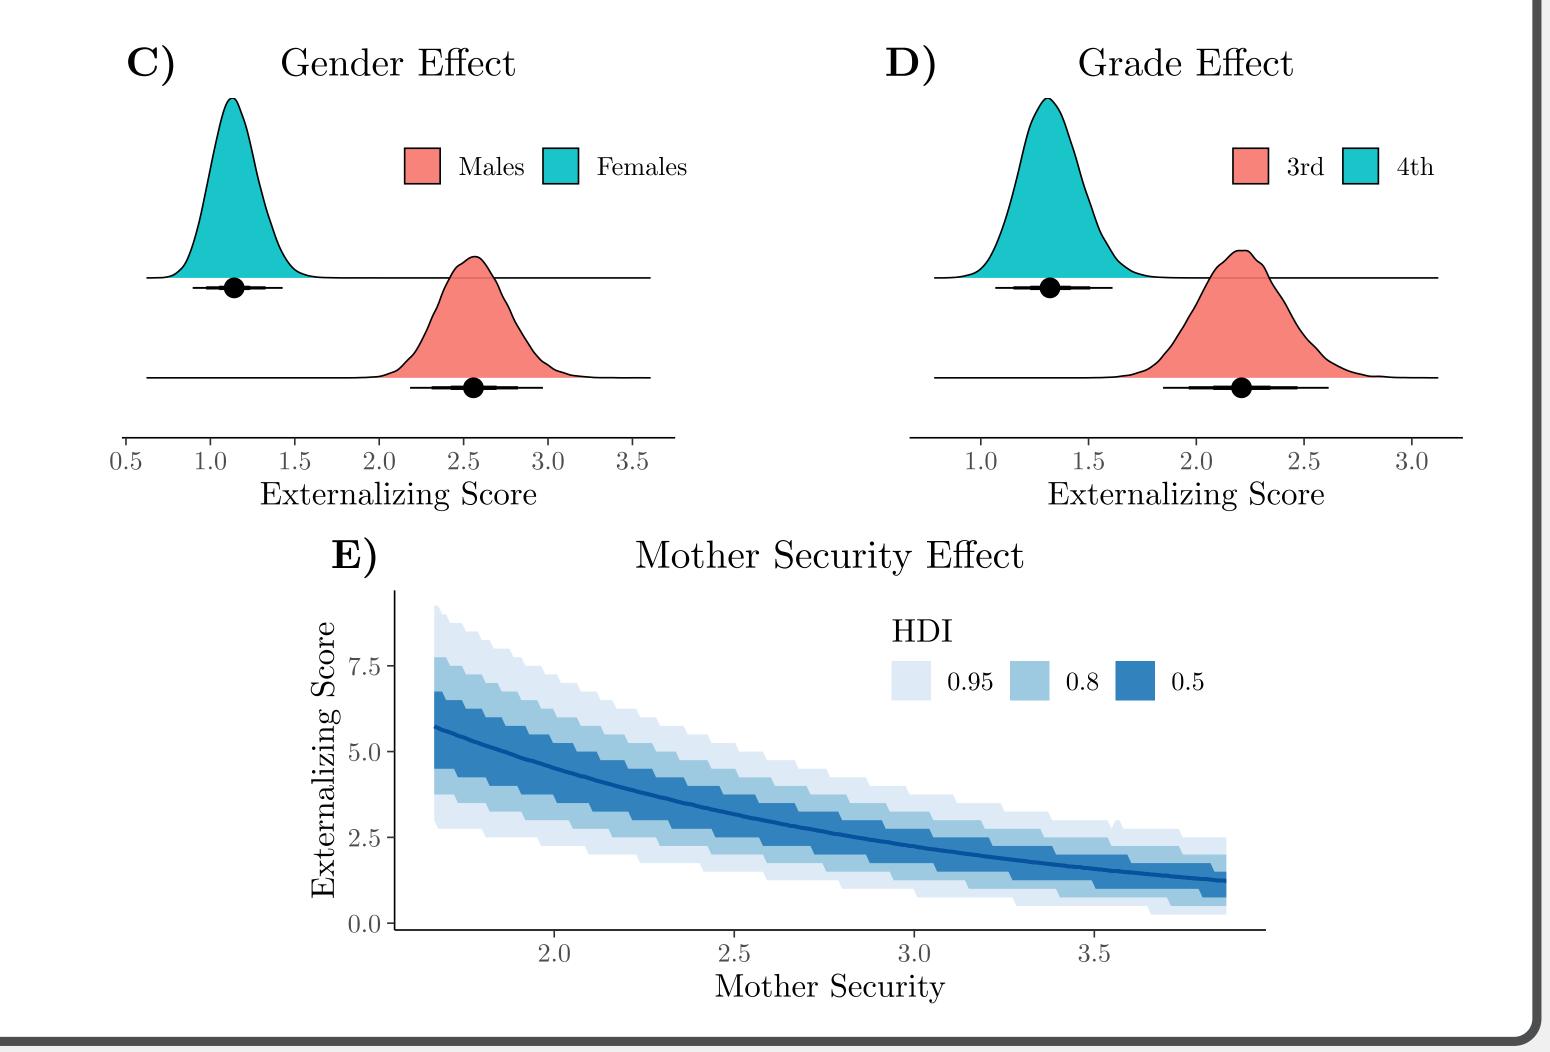

Model	Variables	Int_w	Ext_w	- Int	Ext	
Base	$\mathbf{Gender} + \mathbf{Grade} + \mathbf{FAS}$	0.00	0.00			1.00
Mother	Base+SS mother	0.00	0.90			0.75
Father	Base+SS father	0.34	0.00			0.50
Additive	Base+SS mother+SS father	0.03	0.10			0.25
Interaction	Base+(SS mother*SS father)	0.63	0.00			0.00

Internalizing

• Externalizing

Conclusions

Father and mother attachment play a complementary role in children's socioemotional adjustment.

- Internalizing Problems: boys have more problems than girls. Greater discrepancy between maternal and paternal levels of security are assocaited with more problems.
- Externalizing Problems: boys have more problems than girls. Younger children have more problems than older children. Low levels of maternal security are associated with more problems.
